

# Pattern Detection

The Pattern Detection tool reveals up to 20 patterns to support assessment during the consultation.

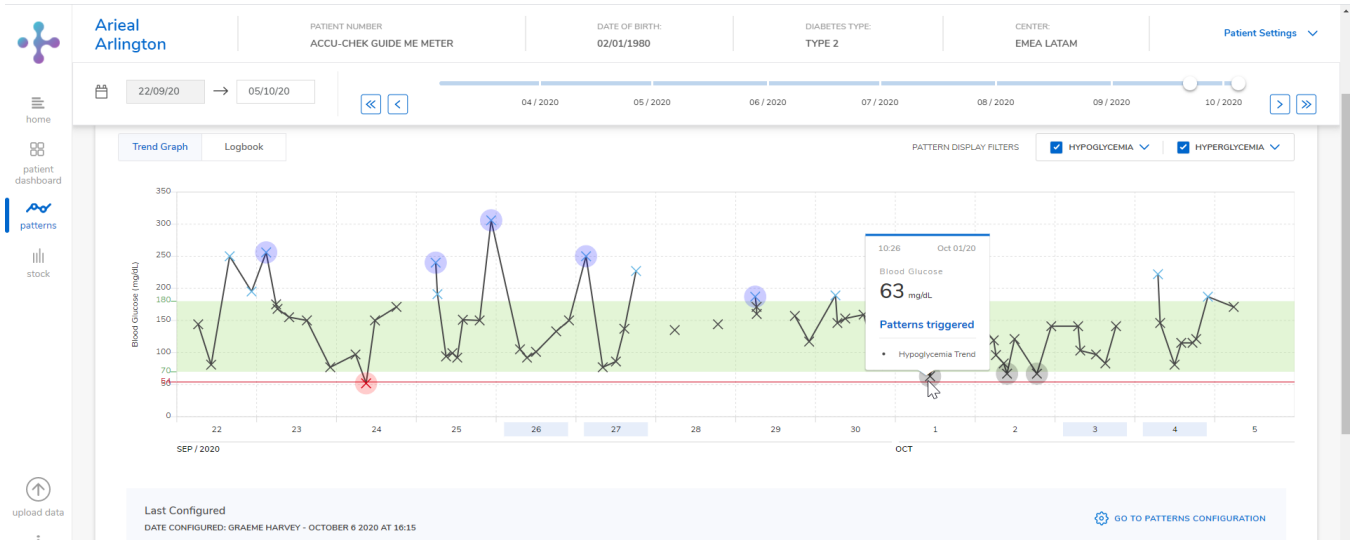

Data represented in the image is for illustrative purposes only. Not actual patient data.

## Patterns are organized in 5 different groups:

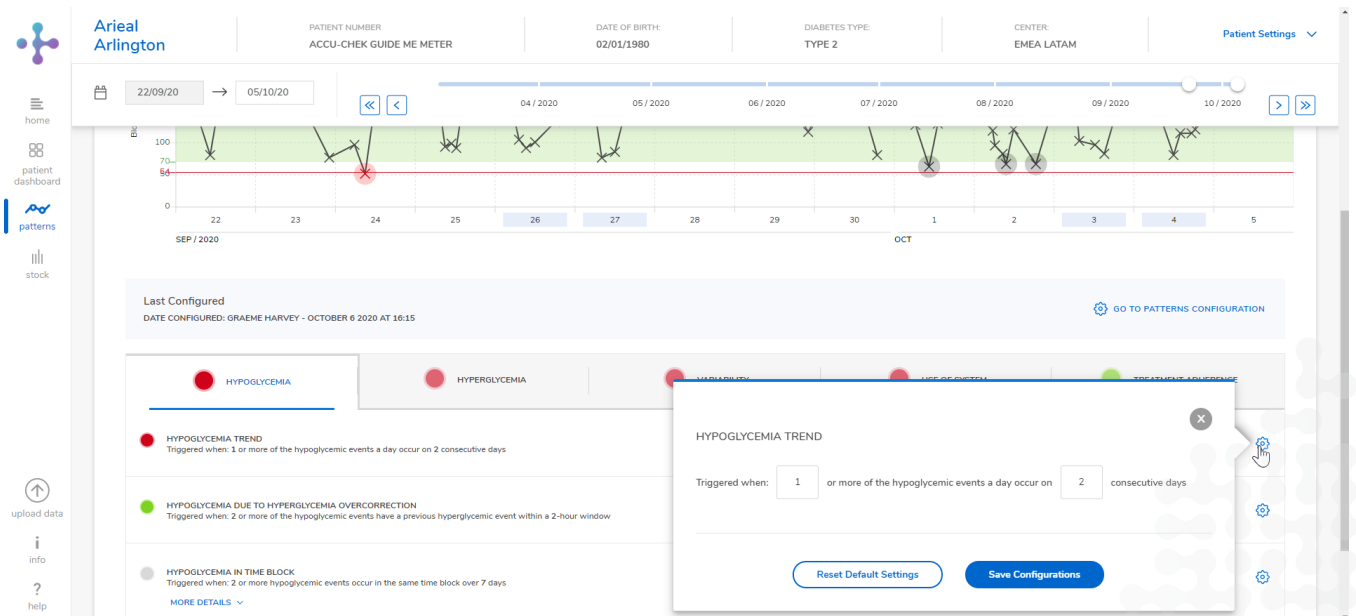

- Hypoglycemia • Hyperglycemia • Blood glucose variability
- Use of the systems • Treatment adherence

Group indicators are shown next to each patterns group by using an easy-to-read visual code.

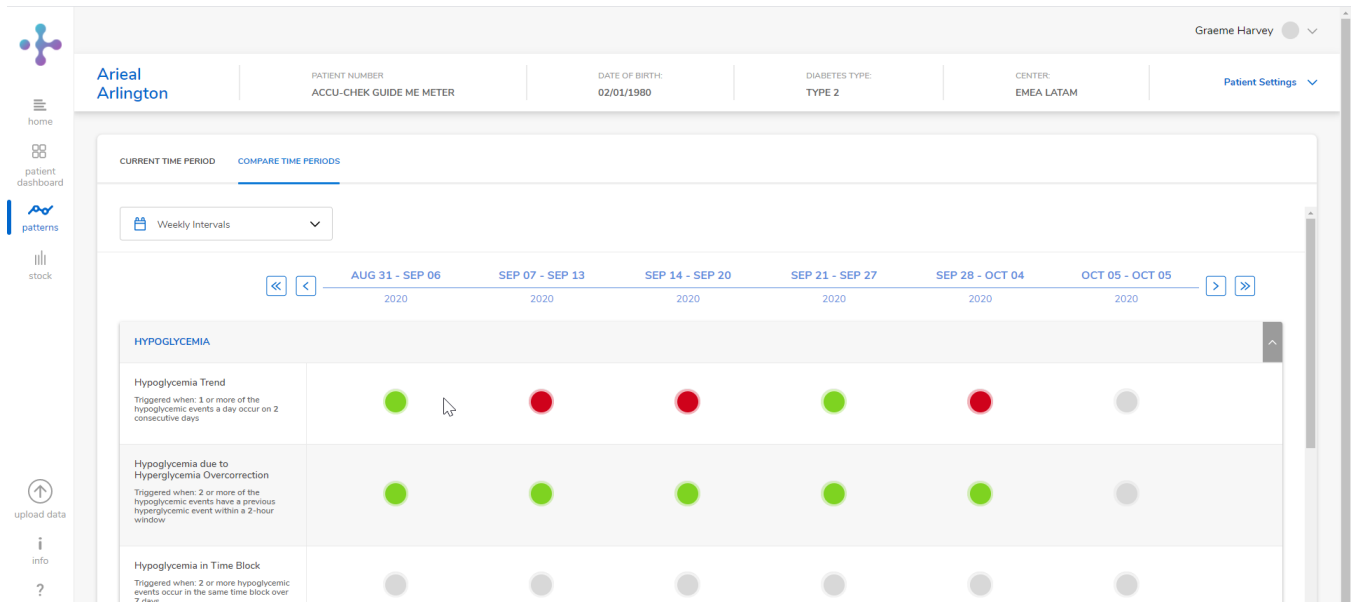

Data represented in the image is for illustrative purposes only. Not actual patient data.

On the Trend Graph, blood glucose values triggering a pattern to red are highlighted with a red circle on the graph and will blink three times before becoming static circles. Hover over the red circles and a pop-up card appears, which gives information about the value and the pattern(s) triggered by this value.

Data represented in the image is for illustrative purposes only. Not actual patient data.

While patterns are pre-defined, you can make changes to the pattern at any time in the **Configure Patterns section.**

Data represented in the image is for illustrative purposes only. Not actual patient data.

It is also possible to view your patient’s pattern data as a comparative table. Simply click the **Compare View** tab in the top-left section above the graph. You then display patterns in weekly, monthly or quarterly intervals.
